Subjective Approach to Probability

- The subjective approach is based on personal judgment, intuition, wisdom, and expertise.

Subjective Approach to Probability

- The subjective approach is based on personal judgment, intuition, wisdom, and expertise.
- It is used in situations where:

Subjective Approach to Probability

- The subjective approach is based on personal judgment, intuition, wisdom, and expertise.
- It is used in situations where:
 - Events do not occur at all.

Subjective Approach to Probability

- The subjective approach is based on personal judgment, intuition, wisdom, and expertise.
- It is used in situations where:
 - Events do not occur at all.
 - Events occur only once.

Subjective Approach to Probability

- The subjective approach is based on personal judgment, intuition, wisdom, and expertise.
- It is used in situations where:
 - Events do not occur at all.
 - Events occur only once.
 - Repeated trials under identical conditions are not possible.

Subjective Approach to Probability

- The subjective approach is based on personal judgment, intuition, wisdom, and expertise.
- It is used in situations where:
 - Events do not occur at all.
 - Events occur only once.
 - Repeated trials under identical conditions are not possible.
- Probability is interpreted as a measure of belief or confidence in an outcome.

Subjective Approach to Probability

- The subjective approach is based on personal judgment, intuition, wisdom, and expertise.
- It is used in situations where:
 - Events do not occur at all.
 - Events occur only once.
 - Repeated trials under identical conditions are not possible.
- Probability is interpreted as a measure of belief or confidence in an outcome.
- Example:

Subjective Approach to Probability

- The subjective approach is based on personal judgment, intuition, wisdom, and expertise.
- It is used in situations where:
 - Events do not occur at all.
 - Events occur only once.
 - Repeated trials under identical conditions are not possible.
- Probability is interpreted as a measure of belief or confidence in an outcome.
- Example:
 - A teacher estimates the probability of a particular student achieving the first rank in a test as 0.99.

Subjective Approach to Probability

- The subjective approach is based on personal judgment, intuition, wisdom, and expertise.
- It is used in situations where:
 - Events do not occur at all.
 - Events occur only once.
 - Repeated trials under identical conditions are not possible.
- Probability is interpreted as a measure of belief or confidence in an outcome.
- Example:
 - A teacher estimates the probability of a particular student achieving the first rank in a test as 0.99.
 - The same teacher estimates the probability of another student failing the test as 0.05.

Subjective Approach to Probability

- The subjective approach is based on personal judgment, intuition, wisdom, and expertise.
- It is used in situations where:
 - Events do not occur at all.
 - Events occur only once.
 - Repeated trials under identical conditions are not possible.
- Probability is interpreted as a measure of belief or confidence in an outcome.
- Example:
 - A teacher estimates the probability of a particular student achieving the first rank in a test as 0.99.
 - The same teacher estimates the probability of another student failing the test as 0.05.
- Subjective probabilities can vary between individuals due to differences in perception, experience, and biases.

Subjective Approach to Probability

- The subjective approach is based on personal judgment, intuition, wisdom, and expertise.
- It is used in situations where:
 - Events do not occur at all.
 - Events occur only once.
 - Repeated trials under identical conditions are not possible.
- Probability is interpreted as a measure of belief or confidence in an outcome.
- Example:
 - A teacher estimates the probability of a particular student achieving the first rank in a test as 0.99.
 - The same teacher estimates the probability of another student failing the test as 0.05.
- Subjective probabilities can vary between individuals due to differences in perception, experience, and biases.
- Even with identical knowledge, two people may assign different probabilities to the same event.
